Why is Visibility Prediction Important?

Fully sighted acuity	20/20	6/6
Low Vision USA	20/40	6/12
Low vision (WHO)	20/60	<u>6/18</u>
Legal blindness threshold (US)	20/200	6/60
Blindness threshold (WHO)	20/400	6/120

	Europe(Geographic)	World
Population	~738 mil	~7.7 bil
Low vision	~26 mil	~164 mil
Completely blind	~3.2 mil	~55 mil

Why is Visibility Prediction Important?

Fully sighted acuity	20/20	6/6
Low Vision USA	20/40	6/12
Low vision (WHO)	20/60	<u>6/18</u>
Legal blindness threshold (US)	20/200	6/60
Blindness threshold (WHO)	20/400	6/120

	Europe(Geographic)	World
Population	~738 mil	~7.7 bil
Low vision	~26 mil	~164 mil
Completely blind	~3.2 mil	~55 mil

Low Vision Community has visual ability BUT we do not yet design environments enabling them to navigate spaces safely.

What is a Visual Hazard?

Unseen edges within the path or route of a traveller can become a hazard

“the Potential to Cause Harm”

...benches,
steps,

ramps,

protruding corners,

columns,

the edge of a subway platform...

DeVAS What current lighting analyses tools miss....

A shift in luminaire location obliterates a 60% difference in the reflectivity of these materials. Note how the edge disappears, in the right image, by moving the luminaire ~ 60cm...

WOULD BE MISSED using typical illumination calculations and analyses.

Design by luminance, not by illumination and material contrast specifications,

IS DESIGN BY WHAT WE SEE

Acuity and Contrast

DeVAS Filter

J Opt Soc Am A Opt Image Sci Vis. 2017 April 1

(Thompson, Legge, Kersten, Shakespeare, Lei)

Our approach builds on the work of Eli Peli, who described a method for transforming an image to simulate the visibility associated with a particular Contrast Sensitivity Function (CSF).

Slide left for reduced Acuity – Slide down for reduced Contrast Sensitivity

Normal Vision CFS

Fine detail visible

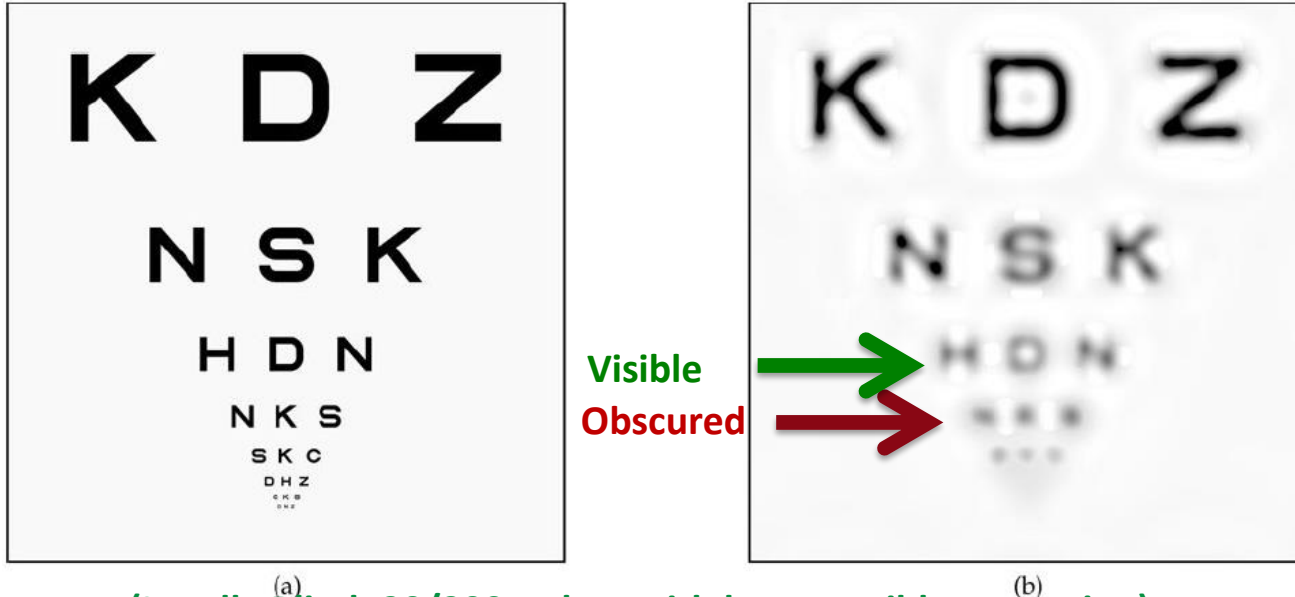

A Low Vision CSF

Fine detail invisible

Fig. 1. The Chung & Legge [15] CSF is an asymmetric parabola when plotted in $f_i - S_j$ space. The plotted values show two instances of the CSF, one shifted left (lower acuity) and down (lower contrast sensitivity) compared to the other.

DeVAS Filter

Removes image details predicted to be not visible, while leaving intact, details predicted to be visible.

(Legally Blind: 20/200 or less with best possible correction)

Fig. 8.

(a) Original logMAR chart, with third line from top corresponding to logMAR 1.1 and the fourth line from the top corresponding to logMAR 0.9. For correct character size, view the chart from a distance equivalent to 3.33 times the width of the chart image. (b) Original logMAR chart, filtered to simulate an acuity of logMAR 1.0. The third line is readable, the fourth line is not.

DeVAS Validation Study Results:

Hazard Visibility Score (HVS) predicts Human Performance!

- As HVS increases, probability of identifying the step correctly increases

5 Views x 5 Platform Variations x 5 Lighting Conditions x 2
250 images x 14 subjects = 3500 samples

DeVAS Limitations

View Dependent

Requires lighting and material specifications

High luminance areas can mask nearby lower luminance details

Strident high contrast material patterns can result in incorrect visibility analysis

NEED Visibility Recommended Practices to evaluate: Compliant/not Compliant

Simulation

Luminance Boundaries

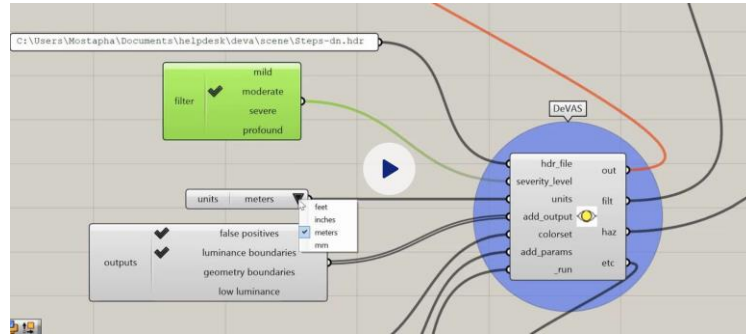

Photographs

DeVAS Future

DeVAS Tools are open source, fully functional prototypes compiled for Windows and OSX. DeVAS Visibility is being incorporated into LADYBUG, a RHINO/GRASSHOPPER plugin. **We welcome other developers.**

rtpict: a gift from Greg that generates and associates all files necessary for DeVAS-visibility

RTPICT(1) RTPICT(1)

NAME
rtpict - generate a RADIANCE picture or layered image using rtrace

SYNOPSIS
rtpict *-n nproc* [*-o*(vr|LRXn|SsmM) *out_dir*] [*-d ref_depth/unit*] [*rtpict options*] [*@file*] *octree*

DESCRIPTION
Rtpict is a script that generates a picture from the RADIANCE scene given in *octree* and sends it to the standard output, or to a file specified with the *-o* option. Most options and defaults are the same as *rpicn(1)*, although a few switches are silently ignored. Options incompatible with multi-processing can generate an error.

The *rtrace(1)* tool is called with *worst(1)* to perform the actual work. This enables the *-n* option for multiprocessing on platforms that support it. If the *-n* option is not specified or is set to 1, then *rpicn* is called directly. There is no benefit in setting the number of processes to anything greater than the number of virtual cores available on your machine. Also, it is very important to set the *-af* option if an irradiance cache is being generated; otherwise, your speed-up will be far from linear.

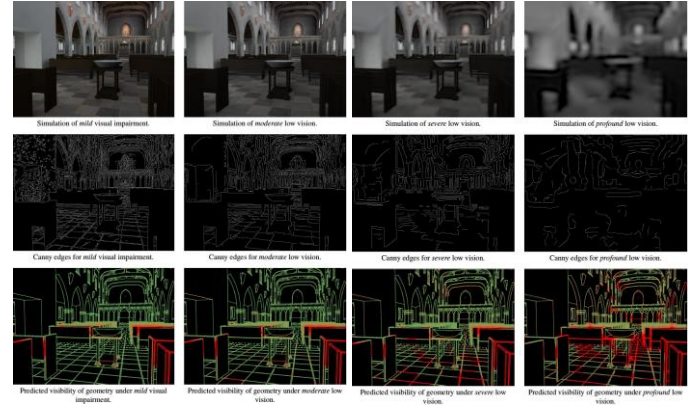

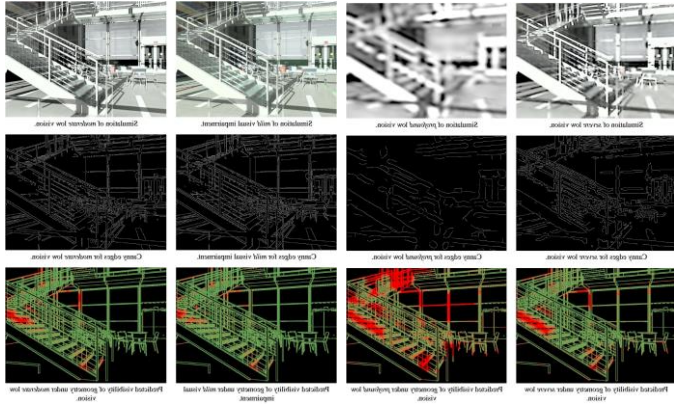

If the *-o* option has additional characters corresponding to output types from *rtrace*, it must be followed by the name of a directory that either exists or will be created to contain image layers, one per output type. The supported types are listed below, and do not include types that are useless or have no convenient representation. The table below shows the correspondence between output type and file name in the specified directory:

v	radiance.hdr
f	mirrored.hdr
x	unmirrored.hdr
l	effective.dpt
L	firstsurface.dpt
R	mirrored.dpt
X	unmirrored.dpt
u	perturbed.irm
N	unperturbed.irm
s	surface.idx
m	modifier.idx
M	material.idx

DeVAS tools enable the designer to analyze and improve visibility of hazards, potentially within the design palette of the project, to aid in the creation of architectural spaces that are accessible to those with vision impairment who make use of vision for mobility.

Standards could potentially be structured for luminance studies, such as DeVAS, where compliance is sought to a visibility metric standard
